Arun Saraswat

AI Methodologist
Scaled Agile, Inc.

The Problem with "Off-the-Shelf" AI

- **The Scenario**

- You buy a powerful AI and ask it: "What is our company's 2026 remote work policy?"

- **The Result**

- It guesses (hallucinates) or says "I don't know."

- **The Analogy**

- Hiring a genius consultant but refusing to let them read your company files.
- They might be brilliant, but they don't know your business.

What is RAG? The Open-Book Test

- **Without RAG (Closed-Book Test)**
 - The AI relies only on what it memorized during training years ago.
- **With RAG (Open-Book Test)**
 - The user asks a question.
 - A "Librarian" (the Retriever) searches your secure company archives.
 - The Librarian hands the AI the exact pages needed to answer.
 - The AI reads the pages and writes a perfect, customized answer.
- **RAG grounds the AI's intelligence in your proprietary data.**

The Core Engine: Finding the Right Files

- How does the "Librarian" find the right files?
- **Semantic Search (Concepts)**
 - You search for "working from home" and it finds documents labeled "telecommuting guidelines."
- **Keyword Search (Exact Matches)**
 - Essential for finding specific things like "Form HR-409-B" or "Error Code 404."
- **The Enterprise Standard: Hybrid Retrieval**
 - You need both working together. This is mandatory for business accuracy.

The 3 Deadliest RAG Pitfalls

Pitfall #1: The Torn-Up Manual

The Technical Term: Poor Data Chunking

- **The Business Problem**
 - We feed documents to the AI by cutting them into pieces. If we cut them arbitrarily, we destroy the meaning.
- **The Result**
 - The AI receives half a table or a broken paragraph and guesses the rest.
- **The Fix**
 - Cut documents logically — by chapters, paragraphs, and complete tables.

Pitfall #2: The Outdated Catalog

The Technical Term: Stale Vector Index

▪ The Business Problem

- Your company policies update, but the AI's search index does not.

▪ The Result

- The AI confidently gives employees the old rules, costing the company money or causing compliance issues.

▪ The Fix

- Build automated pipelines that update the AI's library the moment a new document is published.

Pitfall #3: The "Trust Me" Problem

The Technical Term: Lack of Source Attribution

▪ The Business Problem

- The AI gives an answer but cannot prove where it got the information.

▪ The Result

- Employees lose trust. If the AI hallucinates a fake policy, there is no way to verify it.

▪ The Fix

- Force the AI to provide footnotes: "According to the 2026 IT Policy, Page 4."
- **No citation, no answer.**

The Roadmap: From Prototype to Production

- **Level 1: The Pilot (Exploration)**
 - Manual document uploads. Basic search.
Good for testing, bad for real business.
- **Level 2: The Production Rollout**
 - Automated document updates. Hybrid search (Concepts + Keywords).
- **Level 3: The Enterprise Standard**
 - Strict security — AI only reads what the user is allowed to see.
 - Continuous monitoring and feedback loops (thumbs up/down from employees).

Measuring Success (Beyond the Hype)

How do we know if the AI is actually working?

- Did we find the right files? (Context Relevance)
 - Did the AI stick to the facts? (Grounded)
 - Did we actually answer the employee's question? (Answer Relevance)
-
- **The Golden Rule:**
 - "I don't know" is a successful answer if the data isn't there.
 - **Graceful failure builds trust.**

Building an AI-Native Workforce

Technology is only half the battle. Who will build and scale it?

- **AI-Native Foundations (2-Day Course)**

- Equips the broader workforce with AI fluency.
- They know the work best — they know exactly where RAG will add the most value.
- RAG is one of the primary approaches covered in the course.

- **AI-Native Change Agent (3-Day Course)**

- Equips leaders to move AI from the "POC Graveyard" into scaled production.
- Translators who bridge the gap between business needs and technical reality.
- Covers RAG vs. fine-tuning economics and the full AI Solution Lifecycle.

Key Takeaways

- **RAG is the Foundation**
 - It is the only way to make AI understand your specific business.
- **Use the Open-Book Approach**
 - Ground your AI in your own data and demand exact citations.
- **Avoid the Pitfalls**
 - Cut documents logically, keep your data fresh, and never trust an AI that can't show its work.
- **Empower Your People**
 - Train your workforce to identify RAG opportunities and lead the change.

THANK YOU
