

From prompts to process: How a major French banking group unlocked the full potential of GenAI for Teams

Yann Tisseyre

Head of Gen AI

EXPERIMENT OVERVIEW

What we tested, where, and why

WHAT

Embedding GenAI directly into team ways of working, as part of the team's workflow, not a side tool.

WHERE

A major French banking group, inside 4 agile teams: development, coordination, data, and cross-functional squads.

HOW

1 workshop per week and per team over Q4 2025, facilitated by an Agile Coach with structured prompts and measured outcomes.

WHY

To prove that Agile and GenAI can accelerate each other — and that adoption sticks when woven into existing practices.

Not a lab experiment — a real-world test with real teams, real constraints, and real results.

Sound familiar?

Agile Transformation

Real progress — but slow.
Teams adopt new ways of working...
gradually.

Change fatigue is real.
Each new practice costs effort.

GenAI Adoption

Gen AI tool licenses distributed.
Training delivered. Use cases piloted.

Teams try it once —
then go back to old habits.

Two transformation streams. Sitting next to each other. Neither knowing the other is its solution.

What the data says

Companies leading on AI share one differentiator — it's not the tools

McKinsey — State of AI, 2025

The single biggest differentiator between AI top-performers and the rest: a strong agile delivery operating model.

Anthropic (2026):

Even in AI-exposed roles, actual usage covers only a fraction of what's possible

Industry pattern: GenAI value is found when AI is woven into end-to-end workflows

The typical stages of Gen AI deployment in companies:

1 — Awakening

Individual, sporadic use of Gen AI tools

2 — Use Cases

Targeted pilots — limited, isolated value

3 — Integration

AI in real workflows. Measurable gains.

4 — Transformation

Workflow re-engineering, role evolution

Most companies are stuck at 1–2. Winners are at 3–4.

Where we started

Solid Agile foundations — GenAI not yet landing in teams

Agile Foundation

- Large agile at scale transformation in place
- Agile trains, feature teams, TOM, OKRs
- Structured workflows & governance
- Culture of continuous improvement

✓ Solid base for AI integration

3 GenAI Streams Running

- AI in Products (customer-facing)
- AI for Collaborators / Copilot
- AI for Devs (developer tooling)
- Licenses distributed, training done

✓ Tools & individual training in place

Reality in Teams

- Level 1–2 adoption at best
- Copilot tried once, then silence
- Outputs felt generic — no context
- No workflow integration

✗ Missing: ways-of-working shift

What if Agile and GenAI are each other's accelerator?

01

Put humans at the centre
AI enhances, not replaces

02

Measure everything
Before/after, not just impressions

03

Work within real constraints
No greenfield, no ideal conditions

Setup: 4 teams · Q4 2025 · 1–2 workshops/week · Development, coordination, data & cross-functional teams

Adverse conditions — by design

This wasn't a lab experiment. The environment was deliberately hard:

- ✗ A limited tool : Copilot without internet access
- ✗ Working with existing workflows, not from a blank page
- ✗ No direct connection to internal tools such as Jira or Confluence
- ✗ Teams coming out of an agile transformation — change fatigue was real
- ✗ Some members tech-averse; some initially suspicious of AI ("it will replace us")

The question wasn't "can GenAI work in perfect conditions?" — it was: can it work in yours?

The bidirectional synergy

Agile gives AI its brain. AI gives Agile its speed.

Agile teams are the best-positioned organisations on earth to leverage GenAI — and vice versa.

The Algile method in practice

Workflow-first · Context-rich · Human-in-the-loop

1	2	3	4	5
AI-augmented VSM	Context Engineering	Workflow Integration	Collective Rhythm	Continuous Improvement
Map the workflow. • Measure process time to establish a before/after baseline. • Identify the data sources supporting each step • Identify pain points	Co-create structured context: • data supporting the workflow • Agile methods and artifacts	• Embed GenAI at every relevant step based on team priorities • Fine tune existing methods and explore new ones	• 1h/week with the team. • Shared practice, collective learning — not individual training.	• Each session generates learnings. • Methods improve. • Autonomy grows over time.

What actually changed

	Before	After
Artifacts	Static, dispersed. Confluence months out of date. 6MB documents no AI can use.	Living: OKRs, Personas, Journey Maps, User Stories, test cases, multiple times/day. Gaps auto-detected.
Ways of working	Writing absorbs capacity. 1 User Story = 1 full day spread over multiple days.	Shift from "doing" to "deciding." Less writing, more thinking, more strategic choices.
AI use	Individual, sporadic. Users run out of ideas and fall back to old habits.	Collective, end-to-end. AI understands full workflow context — not just isolated prompts.
Agile adoption	Slow, heavy. New methods hard to apply	Accelerated through AI-supported application
Fear of AI	"It will replace us" — real resistance in some teams.	Disappeared. AI visibly shifts humans toward decision-making, not away from work.

Faster

40–60% time savings on repetitive tasks

Test generation: 1 week → 15 min

User Story drafting: hours → minutes

Better

Higher reviews from the business and clients

Fewer omissions, end-to-end traceability

Living documentation, not static files

Gaps detected automatically

New

Product discovery methods now standard

Strategic framing (OKRs, SWOT) maintained

Teams shifted from executing to questioning

7–8h

coaching per team
for full setup

End-to-end workflow transformation

2–3 months

to autonomy

From coaching to self-sufficiency

100%

strong adoption
across 4 teams

Despite all constraints · 2-3 months

Three things to take home

01

GenAI adoption is a ways-of-working challenge — not a tooling challenge

Tools and training are necessary but not sufficient. Collective workflow integration is where adoption actually happens.

02

Constraints are not the blocker. Approach is

No internet. Limited licenses. No Jira integration. 100% adoption anyway. The method matters more than the environment.

03

Agility and Gen AI synergy is a huge lever

Your artifacts, methods, iteration culture — these are the context that makes AI outputs genuinely useful. Use the synergy deliberately.

Q&A

THANK YOU

Please rate this session!
